Are fiber optic patch cords active or passive

Overview

A fiber-optic patch cord is a cable capped at each end with connectors that allow it to be rapidly and conveniently connected to equipment. When you build or upgrade a fiber network, the same four words pop up everywhere—fiber optic (bare fiber), pigtail, patch cord, optical cable. They are generally sold in large quantities, rather than custom -made, although quite special models are also. Without them, even the best optical modules and switches cannot deliver performance. As data rates increase from 10G → 100G → 400G → 800G, patch cables must handle more bandwidth, more density, and stricter.
