Are optical splitters good for computer rooms

Overview

When employing the first-level splitting method in a residential network, optical splitters offer flexibility for indoor or outdoor installation. Indoor options encompass locations like the community's central computer room, building's weak current well, or floor wiring box. A fiber optic splitter is a passive optical component that divides a single incoming optical signal into two or more outgoing signals, or combines multiple incoming signals into one. Unlike active devices (which require power), splitters operate without electricity, relying solely on the physics of. Outdoor splitters are rugged, weatherproof, and often housed in protective enclosures rated for moisture, dust, and temperature extremes. This point-to-multipoint architecture helps reduce space occupation and effectively save optical cable resources, achieving efficient network expansion at a lower cost.
