## Overview

---

A beam splitter or beamsplitter is an that splits a beam of into a transmitted and a reflected beam. It is a crucial part of many optical experimental and measurement systems, such as, also finding widespread application in. When employing the first-level splitting method in a residential network, optical splitters offer flexibility for indoor or outdoor installation. Indoor options encompass locations like the community's central computer room, building's weak current well, or floor wiring box. Whether housed in box-type, module-type, bare fiber, rack-mount, or tube-type configurations, each serves a specific purpose, from wall mounting to integration into patch panels or equipment racks. a laser beam into two or sometimes more beams, which may or may not have the same optical power.
