Causes of abnormal noise when cable trays are powered on

Overview

One factor that can cause noise related issues is when a power cable, which has a good chance of generating a high amount of electrical noise, is bundled with signal cables. Whenever possible it is best to run your signal cables away from the power cables when setting up. Cable tray failures can cause operational disruptions, equipment damage, and safety risks. This guide discusses common cable tray problems, from loosening and corrosion to grounding issues and installation errors, along with how they operate, turn on and off and start and stop, a certain amount of voltage is discharged to ground. Electrical noise, also known as electromagnetic interference (EMI), is a common issue that affects the performance and reliability of electrical systems.
