Current passing through the laser diode

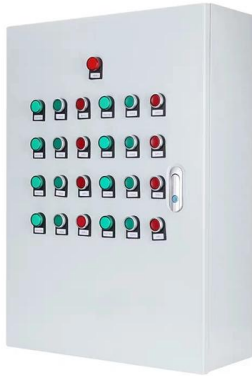

Overview

These values are usually listed in a laser diode's specification sheet so that a user can determine important operational parameters such as the current at which lasing begins, the drive current for a specific laser power, as well as the maximum current the device. Laser diodes (LD) are semiconductor devices that convert electrical energy into high-power optical energy. Stimulated emission occurs when a passing photon triggers the recombination of an electron and hole, with emission of a second photon with the same frequency (energy), momentum, and phase. By observing a few simple rules that govern diode lasers' properties, driving them loses much of its mystery.
