Fiber optic cables are prone to breakage when stripped

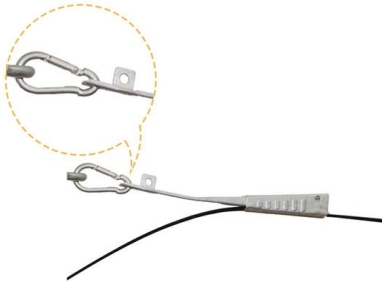

Overview

Even if the stripped fiber is kept free of damage during stripping and handling prior to inserting it into the ferrule, it is still very susceptible to breaking if it is not completely encapsulated in epoxy within the ferrule. How easy it might be to break a fiber optic cable depends on its protection level. These fibers are typically surrounded by a protective coating, a strengthening fiber, and an outer jacket. While these cables are engineered for durability (with some rated to last 25+ years), they are not invulnerable.
