High-speed optical cable construction

Overview

This guide explains fiber optic cable construction, the difference between tight buffer and loose tube structures, and compares eight common cable types used in data centers, enterprise networks, and FTTH deployments. A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry light. The optical fiber elements are typically individually coated with plastic layers and contained in a protective tube. They support high-speed, interference-resistant communication and are particularly effective in applications that require high bandwidth, low latency, and strong signal integrity. We offer full-service OEM and ODM solutions for fiber optic cables, assemblies, and connectivity products — from design and prototyping to global production and logistics.
