How are optical cables typically laid

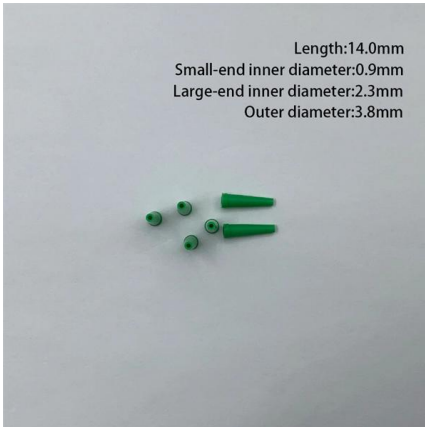

Overview

Generally, fiber optic cables are trenched underground, although in some cases they may be laid overhead. A fiber-optic cable, also known as an optical-fiber cable, is an assembly similar to an electrical cable but containing one or more optical fibers that are used to carry light. Cables are typically laid in conduit to protect them from environmental factors and to facilitate future cable. Due to different construction conditions and requirements, optical cables may be laid in different ways in various scenarios. The specific environmental conditions of a project determine which method - or combination of methods - is the.
