How long does it take for a cold joint to work

Overview

Proper surface preparation, adequate bonding agents, and timely placement. The time it takes for a cold joint to form depends on several factors, including the curing conditions, ambient temperature, and the properties of the concrete mix. Typically, if fresh concrete is placed more than 30 minutes to 2 hours after the initial set of the previously poured concrete, a cold joint is formed. The delayed placement prevents full integration and knitting between the concrete batches and might lead to reduced structural robustness, increased. A cold joint is a common imperfection in concrete construction, occurring when fresh concrete is poured next to a section that has already begun the setting process.
