Covering the Basics of Beamsplitters -- Firebird Optics

Beamsplitters are usually made as a reflective device that splits the beam into exactly 50/50 with half of the beam being transmitted and the other half

How to Select a Beamsplitter

Upon encountering the back surface of the substrate, a small portion of the light is reflected back along the path of the reflected beam, creating a ghost beam with a small displacement ($\sim 0.3 \times$ the thickness)
