

How many layers remain in the core switch

Overview

Typically, core switches are Layer 3 switches equipped with robust network management capabilities. They are characterized by numerous ports and high bandwidth, offering greater reliability, redundancy, throughput, and lower latency compared to access and aggregation switches. It can be considered a central network layer that performs all the functions, like monitoring traffic and empowering the whole system. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. The primary transmission and routing of data signals take place at the core layer only. It's responsible for accurately routing communication among layers and departments of different sections.
