How to jumper the single-mode fiber optic module

Overview

Ensure that the optical connector at each end of a fiber jumper is of the same type as the port to which it will be connected. It receives the optical signal on one port, converts it into an electrical signal, and then retransmits it as an optical. Before testing or troubleshooting your installed fiber optic cables, make sure you subtract the losses from your test cables so you don't introduce extra losses into your fiber optic cable link. These cables link the end devices to a network or join the network components in a fiber optic configuration.
