How to place the fiber optic junction box

Overview

OPGW cable joint box installation involves several key stages: selecting the appropriate location, preparing both the cable and the joint box, splicing fibers, and sealing the joint box properly. Compared to conventional copper cables, fiber optic cables offer a significantly higher bandwidth and are less susceptible to interference. The fiber closure is used to protect and distribute data between two or more cables. In general, installing the optical fiber distribution box can be divided into three steps: installing the optical fiber distribution box on the rack, introducing the optical cable into the optical fiber distribution box, and planning the optical fiber path in the optical fiber distribution box.
