Inverse Time Relay Protection Tester

Overview

An Inverse Defined Minimum Time (IDMT) Calculator is an online (or) Excel-based tool that calculates the operation time of protective relays using the inverse time characteristics of overcurrent protection systems. How to convert from a Time Dial Multiplier (TDM) to a Time Dial (TD)?

For IEEE curves, convert from a Time Dial Multiplier (TDM) to a Time Dial (TD) as follows: What is Inverse Time Overcurrent (TOC)?

Inverse Time Over Current (TOC), also referred to as Time Over Current (TOC), or Inverse Definite. In some relays, a Time Dial Multiplier is used instead of the Time Dial setting, but their functions are similar. In addition to the verification of various relays (such as current, voltage, inverse time limit, power direction, impedance, differential, low cycle, synchronous, frequency, DC, intermediate, time, etc.) and microprocessor-based protection, the whole group of tests can be carried out to simulate. Essential tool for relay technicians, protection engineers, and commissioning specialists.
