Micro Modular Data Center cfd

Overview

Abbreviated as micro-module, it is a small rack cluster formed by a certain number of two rows of back-to-back or face-to-face IT racks, uninterruptible power supply, near-end cooling equipment and so on through closed aisle. At Oracle Cloud Infrastructure (OCI), with our trusty cooling strategies, the integration of computational fluid dynamics (CFD) analysis with data center engineering design principles plays a pivotal role in designing and implementing efficient and reliable cooling systems for data centers. Supporting this Hyperlocal environment is The Edge - processing ever increasing volumes of data with short latencies to quickly leverage the insights provided by this information, in near real time. Modular Data Centers (MDCs) can solve those challenges in an economical, fast and energy-efficient manner. When built and implemented correctly, they can greatly contribute to sustainability goals. MDCs optimize time-to-market with their pre-fabrication and assembly process, significantly reducing. Prefabricated modular data centers, often referred to as integrated modular solutions or containerized data centers, are designed to cater to specific business needs, providing a tailored and secure infrastructure that differs from conventional brick-and-mortar designs.
