Multimode and Single-mode Fiber Optic Heads

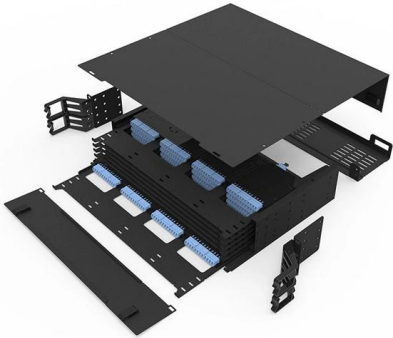

Overview

This guide explains single mode and multimode optical fiber differences in structure, distance, cost, transfer speed, types of connectors, and of widely used network standards, so that you can have a better knowledge and confidently make a decision on which Fiber fits your. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets. But not all fiber cables are created equal: multimode (MM) and single mode (SM) fibers are the two primary types, each engineered for specific use cases, from short-range data center connections to transcontinental telecom backbones. Single mode fiber uses an ultra-thin core to send light in a single, straight path—like a dedicated laser beam—making it the undisputed champion for long-distance, high-bandwidth runs. At their core, all optical fibers perform the same fundamental task – guiding light. Fiber optic cables use light to transmit data, while traditional cables, such as copper cables, use electrical signals.
