# **New type of pallet bridge**

## Overview

---

Bridge Cross Rack (also known as Bridge Across Aisle or Over-the-Dock storage) is a variation of selective pallet rack that increases storage density by utilizing the cubic space above forklift aisles or loading docks. When it comes to building bridges, for example, folks are exploring all kinds of options. One that's been catching some attention lately is the Pallet Type Bridge — mainly because it's pretty efficient and versatile. Speedlock P90 Pallet Racking is the most advanced adjustable pallet racking system on the market. The mobile racking system adapts flexibility to your requirements, saves space, reduces energy costs and increases your storage capacity - ideal for new builds or retrofits. However, these racking systems and the way that we use and maintain them are not fixed and unchanging - in fact, they are constantly being improved and tweaked. The new PB3000 pallet bridge display provides an elegant solution to cross-merchandise products that are complementary to your palletized goods. Your supplied graphic panels simply slide into the side supports while mounting holes on the tray face easily accepts most types of rigid signage panels.

## New type of pallet bridge
