No tripping when the small busbar is grounded

Overview

Interlocking - Interlocking is used to prevent unwanted tripping of the busbar protection relays. Busbar protection (BBP): Protection intended to detect and operate to clear faults on a busbar. Multiple segment busbars, such as double busbar and triple busbar arrangements, are used to balance loads between various transmission circuits, minimize the physical space required for a substation, and provide simpler operating procedures when performing breaker maintenance.

No tripping when the small busbar is grounded

BUSBAR PROTECTION

The Small-zone faults between CTs and circuit breakers are normally detected by the busbar protection but tripping of the circuit breaker will not clear the fault.

High Voltage Busbar Protection

In order to keep the high order of integrity required for busbar protection, it is an almost constant practice to make tripping depend on two separate measurements of fault quantities.
