# **Optical module light and signal reception indicators**

## Overview

---

This article will systematically analyze the core performance indicators of optical modules from five dimensions: transmit optical power, receive optical power, overload optical power, receiver sensitivity, and extinction ratio. Optical modules, including the advanced 25G SFP28 transceiver, play a pivotal role in modern communication systems, facilitating the transmission of optical signals. The transmitting interface inputs electrical signals of a certain bit rate, which are then processed by internal driver chips. Industry pundits have recently speculated that demand for 100G/400G switches may take off in 2019, prompting optical transceiver module vendors to sample data center switches with high data transmission rates earlier than expected.
