Safety Protection During Optical Cable Laying Construction

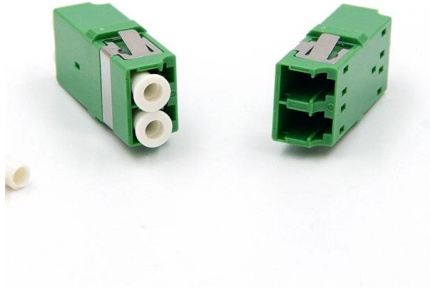

Overview

This guide highlights essential precautions including wearing protective gear, disconnecting power sources, handling fiber scraps carefully, avoiding face or eye contact, following regulatory standards, using adequate lighting, and keeping food or beverages away from work areas. Besides the usual safety issues for all construction, generally covered under OSHA rules in the US (OSHA 10 and 30), fiber optics adds concerns for eye safety, chemicals, sparks from fusion splicing, disposal of fiber shards and more, covered in Part 1. When splicing the fibre optic cables, work in a clean and dry environment to prevent contamination of the fibres. Even the output of OTDRs, WDM and fiber amplifier systems, which are much higher than LED systems, are still well below that. Where reels are supplied with protective material fitted over the cable, the protection should remain in place until the cable will be installed. es conform to the guidelines expressed in the American National Standards Institute document (ANSI Z535) for hazard alert messages.
