Single-mode and multi-mode fiber optic cable markings

Overview

Here's how to tell the difference between single mode and multimode fiber through several key indicators: Fiber Color: This is often the easiest visual cue. Multimode fiber usually comes in orange (OM1 and OM2), aqua (OM3 and OM4), or lime green. Choosing the right type of fiber optic cable is essential for reliable and cost-effective network performance. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets. But not all fiber cables are created equal: multimode (MM) and single mode (SM) fibers are the two primary types, each engineered for specific use cases, from short-range data center connections to transcontinental telecom backbones.
