The building s temporary electrical distribution box is grounded

Overview

The electrical system is intentionally grounded (connected) to earth in a specific manner to limit the voltage imposed by direct or indirect lightning strikes, line surges, or unintentional contact with higher voltage lines and the earth connection is also used to stabilize. A safe, efficient temporary wiring system protects the client, the employer and the employee by minimizing serious injuries, fires, power failures and downtime. The recommended procedures in this data sheet are intended to eliminate the unsafe. The EGFCP helps operate devices such as circuit breakers and fuses or ground-fault detectors in ungrounded systems. Why is it so important to ensure you have proper grounding and bonding for your electrical system?

First and foremost is the safety of personnel within a building. The subject of grounding and bonding can be confusing this is especially true for portable and vehicle (trailer) mounted generators used in the field to supply temporary/emergency power for applications such as construction, industrial, special events and emergency power during disasters.
