## Overview

---

A single-mode optical module is a type of transceiver designed to transmit data over a single mode of light through an optical fiber. In addition, the CWDM color light module and the DWDM color light module are both single-mode fiber modules. According to industry common specifications, 850nm is exclusively used for multi-mode. This means you can find combinations such as single-mode single-fiber modules or multi-mode dual-fiber modules. Most single-fiber modules are single-mode due to the complexity and cost of wavelength multiplexing in. Typically, single mode SFP modules are labeled as "SM" or "single mode," while multimode modules may be labeled as "MM" or "multimode. Modes are the possible solutions of the Helmholtz equation for waves, which is obtained by combining.
