## Extraction and characterization of cellulosic fibers from cattail

The weight loss rate, fiber diameter, moisture regain and water contact angle of the obtained fibers decreased as the alkali concentration or urea concentration increased due to the partial removal of

## Effect of fiber surface treatment on mechanical, interfacial, and

Surface treatment of cattail, a lignocellulosic renewable fiber, was investigated to determine the conditions that would reduce moisture absorption while maximizing the properties of cattail fiber

## RBPseg: Toward a complete phage tail fiber structure atlas

Here, we introduce RBPseg, a method that combines monomeric ESMFold predictions with a structural-based domain identification approach, to divide tail fiber sequences into

## The enzymatic hydrolysis of pretreated pulp fibers predominantly

It appears that, at the fiber level, pretreated pulp fibers are hydrolyzed through a two-step mode of action involving an initial rapid fragmentation followed by simultaneous swelling and

## Investigation of the structure of ramie fibers by enzymatic peeling

In this study, enzymatic peeling, using xylanase and laccase coupled with PM, FLSM, and SEM, was confirmed to be an effective and efficient method to characterize the inner structure of ramie fibers.

## Tail Fiber: Types, Functions, and Common Interfaces

Similar to fiber optic jumpers, tail fibers are classified into single-mode and multimode types, differing in color, wavelength, and transmission distances. Generally, multimode tail fibers are

## How to Tie in Perfect Tails Every Time

That being said, it is important to think sparingly when tying in tail fibers on nymphs and dry flies. Having too many fibers can look unnatural. In this

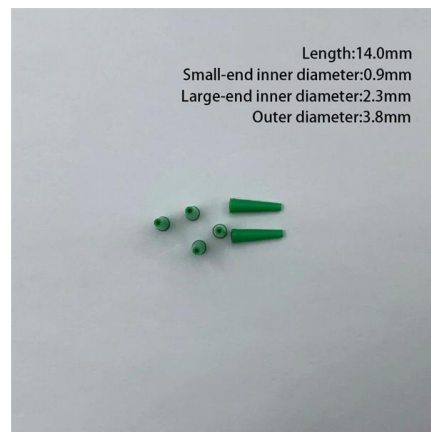

### What are tail fibers?

The tail fibers or spikes, situated at the far end of the phage tail, facilitate the attachment of the phage to a specific receptor found on the matching bacterial host's surface. These receptors may include
