What frequency bands do communication optical modules use

Overview

According to the International Telecommunication Union (ITU-T) standards, optical fiber communication bands can be systematically divided into multiple bands: O, E, S, C, L, and U. Optical fibre communication utilizes specific wavelength bands, frequently referenced by optical engineers. The values presented below are approximate and should be considered as such, as standardized values are still evolving. These bands determine how light travels through fiber, directly influencing signal quality, reach, and DWDM grid design.
