# **Which wavelength band is used for installing and maintaining optical power meters**

## Overview

---

When NBS (now NIST) created a calibration standard for power meters, they used 850, 1300 and 1550nm so meter calibration is usually at those wavelengths, although some manufacturers offer both 1300 and 1310 or call it 1300/1310 because it is an irrelevant difference in calibration. These so-called wavelength regions—also known as optical wavelength transmission bands—are essential to modern fiber networks. Optical power meters used for testing fiber-to-the-user (FTTx) installations operating downstream from the headend should be calibrated for which wavelengths?

490 nm, 1,550 nm, and 1,577 nm. , O-band, C-band, L-band) represents a specific range of wavelengths optimized for minimal loss, dispersion, or amplification. This standardization ensures interoperability between different manufacturers' equipment and facilitates the global deployment of fiber optic networks. That is, for example, the 1,240-1,380 nanometer (nm) O-band, the 1,340-1,495 nm E-band, or the 1,450-1,650 nm bands covering the C-, L- and U-bands.
